

# Should you consider a Urine Test in your follow-up?

Following discussions with your consultant, are you considering using a urinary biomarker test for every other follow up?

(Consider how uncomfortable you find cystoscopies and how eager are you to reduce how many cystoscopies you have).

**Yes**

Investigate use of urinary biomarkers.

**No**

Continue with regular cystoscopy plan.

**Decide which urinary biomarker test would be most suitable for you.**

- How likely the test is to be positive in people with cancer
- If the test is positive, how likely is there to be cancer.
- The probability that a person with a negative screening test truly does not have cancer.

**Make decision about future management.**

**Investigate availability and cost**

**Final decision and action**

Check you are comfortable with the advantages and disadvantages of your decision.

**Cystoscopy**

**Urinary biomarker test**

Next follow up: **cystoscopy**
